Defect #	Description	Severity	How to Correct
1	We forgot to put a Back Button in Profile Page	2	Put a Back Button there
2	In my database, we did not implement a one-to-many relationship in a user's friend's list.	1	Reconstruct our database schema so that we can realize one-to-many functionality.
3	Requests sent from client side are sometimes different from what are supposed to be sent to the server.	1	Make the requests in the same format.
4	Our dialog page's user interface is not user friendly enough and sometimes it is hard for people to read text messages from their friend.	3	Increase the size of the font and make more spaces between sentences. Redesign the dialog window if necessary.

5	User is not able to login with their ID. They are only allowed to use e-mail address.	2	The system now supports login with ID.
6	Our server does not have any precaution for security	2	We will try to implement md5 password encode into database
7	Users cannot personalize their icon by uploading whatever picture they like. It is unlikely that we will implement this function as said in the project backlog	3	Due to developing time constraint, we don't think this defect is going to be fixed.
